Versacon® Classic 5100 Series Screen Ink is a solvent-based ink system for container printing which exhibits adhesion to various plastics, glass and some metals. 5100 Series has excellent resistance to a wide range of solvents and chemicals used in cosmetics, personal care and household cleaning. As a high gloss, fast drying, single part system, 5100 Series shows good adhesion immediately upon drying, while final properties will be achieved in 5-7 days.

Substrates
- Treated polyethylene
- Treated polypropylene
- Glass
- Metals

Note: Due to variations in the type and manufacture of plastics, glass and metals, pre-testing must be done prior to any production run. Adhesion to the substrate does not guarantee satisfactory results with other end-use specifications.

Substrate recommendations are based on commonly available materials intended for the ink's specific market when the inks are processed according to this technical data. While technical information and advice on the use of this product is provided in good faith, the User bears sole responsibility for selecting the appropriate product for their end-use requirements. Reference the ‘Quality Statement’ at the end of this document.

User Information
Mesh
230-355 tpi (90-140 tpcm) monofilament polyester mesh for most applications.

Stencil
Use direct emulsions and capillary films which are solvent resistant.

Squeegee
70-80 durometer polyurethane squeegee.

Coverage
Estimated 1,200 – 3,000 square feet (110 - 275 square meters) per gallon depending upon ink deposit. Reference www.nazdar.com for examples of coverage calculations.

Printing
The 5100 Series ink may be thinned with RE212 Thinner or RE185 Thinner prior to use (see the Additives section). Add only enough ink to the screen to be able to print for 5-10 minutes. Add additional ink in small increments throughout the print run to maintain screen stability. Thoroughly mix the ink prior to printing. Improper mixing can lead to inconsistent color and ink performance.

Plastic substrates must have a minimum surface energy level of 48 dynes/cm for optimum ink flow and adhesion.

Maintain ink temperature at 65°-90°F (18°-32°C) for optimum print and cure performance. Lower temperatures increase the ink viscosity, impairing flow and increasing film thickness. Elevated temperatures lower the ink viscosity, reducing print definition and film thickness.

Pretest to determine optimum printing parameters for a particular set of ink, substrate, screen, press, and drying variables/conditions.

Nazdar does not recommend inter-mixing of 5100 series with other inks besides the 5100 series.

Drying / Curing Parameters
5100 Series should air dry to touch in 8-15 minutes depending on the ambient conditions and screen mesh used. For best results, force drying at temperatures of 90°F - 180°F (32°C - 83°C) is recommended. Good air flow at proper temperature is the key to accelerating dry cycles and is necessary to remove the vaporized solvents. Multiple layers of ink may require longer drying times than a single layer.

Clears / Varnishes
Mixing Clear / Metallic Mixing Clear: Use 5126 Mixing Clear to reduce the density of colors or as a clear base for specialty additives such as silver / aluminum metallic additives. Gold or bronze metallic additives are not recommended to be mixed with the 5126 Mixing Clear or other 5100 inks. See the Special Effects section.

Common Performance Additives
The market specific performance properties of the 5100 Series should be acceptable for most applications without the need for additives. When required, any additives should be thoroughly
mixed before each use. The addition of additives, regardless of amount, may shorten the pot life of the mixture. The pot life of the mixture depends not only on the type and amount of additive but also on the processing environment.

In some cases, additives may hinder overall performance. Inter-coat adhesion between colors that include additives must be thoroughly qualified prior to full scale production. Inks containing additives should not be mixed with other inks.

Example for additives: Ink at 100g with 8% of an additive is calculated as:

\[
100\text{g ink} + 8\text{g additive} = 108\text{g total}
\]

**Thinner / Reducer:** Use RE185 Reducer to reduce the viscosity of these inks. Add up to 15% by weight.

Use RE212 Thinner to reduce viscosity, optimize on-screen stability and printability, enhance cure and chemical resistance. Add up to 15% by weight.

**Retarder:** Use CARE53 Gel Retarder to improve on-screen stability without reducing viscosity. Add up to 5% by weight. The addition of retarder will extend the drying time.

**Flow Agent:** Use CARE22 Flow Agent to help reduce pinholes or orange peel appearance. Add up to ½% by weight.

**Catalyst:** Use V5070 Catalyst to increase cure speed and chemical resistance. Add up to 10% by weight. Ink mixed with V5070 Catalyst has a 1-2 day pot life in a tightly sealed container.

**Thickener:** Use SIPI414 Thickening Powder to increase viscosity. Add powder starting at ½% by weight. The addition of SIPI414 may affect printability and lower the gloss of the ink film. The addition of SIPI414 requires power mixing of the ink.

**Cleanup**

**Screen Wash (Prior to Reclaim):** Use IMS201 Premium Graphic Screen Wash, IMS203 Economy Graphic Screen Wash, or IMS206 Graphic Auto Screen Wash.

**Press Wash (On Press):** Use IMS301 Premium Graphic Press Wash.

---

**Storage / Shelf Life**

Store closed containers at temperatures between 65°-78°F (18°-25°C). Storing products outside of these recommendations may shorten their shelf life. Ink taken from the press should not be returned to the original container; store separately to avoid contaminating unused ink.

Standard 5100 Series items are useable for a period of at least 24 months from the date of manufacture. To obtain the official shelf life letter, Contact Nazdar Technical Service at InkAnswers@nazdar.com or see contact listing at the end of this document.

---

**General Information**

**Ink Handling**

All personnel mixing and handling these products must wear gloves and eye protection. Clean up spills immediately. If ink does come in contact with skin, wipe ink off with a clean, dry, absorbent cloth (do not use solvent or thinner). Wash the affected area with soap and water. Consult the applicable Safety Data Sheet (SDS / MSDS) for further instructions and warnings.

For assistance on a wide range of important regulatory issues, consult the following Regulatory Compliance Department link at http://www.nazdar.com or contact Nazdar Ink Technologies - World Headquarters (see contact listing at the end of this document).

---

**Adhesion Testing**

1. Scratch surface – the ink surface should resist scratching.
2. Cross hatch tape test – per the ASTM D-3359 method, use a cross hatch tool or a sharp knife to cut through ink film only; then apply 3M #600 clear tape on cut area, rub down, and rip off at a 180 degree angle. Ink should only come off in actual cut areas.

---

**Manufacturer’s Product Offering**

Based on information from our raw material suppliers, these ink products are formulated to contain less than 0.06% lead. If exact heavy metal content is required, independent lab analysis is recommended.
Standard Printing Colors
Standard Printing Colors have excellent opacity. These colors are intended to work as supplied.

Pantone Matching System® Base Colors
Pantone Matching System Base Colors are used to simulate the Pantone® Formulation Guide. These inks are press ready, can be used in matches to achieve Pantone color simulations, or let down with mixing clear. ColorStar® Color Management System software uses Pantone Matching System Base Colors to match Pantone colors. Blend formulations are also available at www.nazdar.com using ColorStar On-Line.

360 Series Colors: 51360-51369 colors are formulated to have no white or opaque pigments. This allows the colors to be more vibrant and allows for a better match of intense and darker colors.

Single Pigment Toners
Single Pigment Toners produce clean and vibrant colors. Single Pigment Toners can be used as supplied, in color matches or let down with mixing clear.

Special Effect Pigments
When inks are to be printed with a special effect color, all ink layers must be evaluated for intercoat adhesion before proceeding with the production run. Pigments may settle in the container; prior to printing, thoroughly mix the ink.

The following special effect pigments may be added to 5100 Series. Contact Nazdar for the item number(s) and availability of special effect products. Technical Data Sheets for each of the following special effect pigments can be found at www.nazdar.com.

Metallic Silver (aluminum): Add up to 8% by weight.

Chemical reactions in metallic inks may result in viscosity, color and printability changes over time; due to this, mix only enough metallic ink to be used the same day.

Metallic Gold (bronze): Gold or bronze metallic powders are not recommended to be mixed with the 5126 Mixing Clear or other 5100 inks. The addition of gold or bronze powders inhibits cure and affects chemical resistance. As an alternative, use the 51185 Gold.

Pearlescent / Interference: Add up to 20% by weight.

Multi-Chromatic: Add up to 10% by weight.

Phosphorescent: Add up to 20% by weight.

Fluorescents: Add up to 25% by weight. Fluorescent colors fade quickly with exposure to ultraviolet light.

Color Card Materials
The following is a list of available screen printed samples of the 5100 Series.

Special Effects Color Card (CARDSP): shows Metallic, Pearlescent, Interference, Multi-Chromatic, Phosphorescent, and Fluorescent effects mixed with clear.

Packaging / Availability
Contact your Nazdar distributor for product availability and offering.

Standard Ink Items
Check with your distributor for available container size.
